

Sales & Service

You should use the following process for checking and adjusting the speedometer PPU code.

- Turn on the ignition whilst simultaneously holding in the odometer reset button.
- Cycle through the menu and select "SETPPU" by holding in the odometer reset button until a flashing 6-digit code appears on the screen.
- This value can be adjusted by pressing the odometer reset button to increase each individual number as it cycles through.
- Once the desired number has been entered, the completed figure will begin to flash, at which point you will need to save this setting by once again pressing the odometer reset button. If performed correctly, the screen will now display "DONE" and you can test your new setting on the road.
